Modifications to the ventilator circuit such as connecting Y-piece directly to the endotracheal tube to reduce the dead space in ventilator circuit. 19 Changes to the circuit in mechanical ventilation including removal of heat and moisture exchanger and using heated humidifier was also shown to reduce hypercapnia without the need for increase in the need for increasing tidal volumes or the respiratory rate.

For mechanically ventilated adults with COVID-19 and moderate-to-severe ARDS: The Panel recommends using a higher positive end-expiratory pressure (PEEP) strategy over a lower PEEP strategy (BII) . For mechanically ventilated adults with COVID-19 and refractory hypoxemia despite optimized ventilation, the Panel recommends prone ventilation for 12 to 16 hours per day over no prone ventilation (BII) .

Lung protective mechanical ventilation (MV) is the recommended strategy for the management of acute respiratory failure, which aims to protect the lung. This is when mechanical ventilation is employed with the use of a low tidal volume strategy (4-8ml/kg predicted body weight) and limiting plateau pressures to less than 30 cmH2O.
