In the 1980s vector coding or vector quantization has come of age and made an impact on the tech nology of signal compression. Several commercial products for speech and video coding have emerged which are based on vector coding ideas.

VECTOR QUANTIZATION AND SIGNAL COMPRESSION
Vector quantization is a classical quantization technique from signal processing that allows the modeling of probability density functions by the distribution of prototype vectors. It was originally used for data compression. It works by dividing a large set of points into groups having approximately the same number of points closest to them. Each group is represented by its centroid point, as in k-means and some other clustering algorithms. The density matching property of vector quantization i

In signal processing, data compression, source coding, or bit-rate reduction is the process of encoding information using fewer bits than the original representation. Any particular compression is either lossy or lossless.Lossless compression reduces bits by identifying and eliminating statistical redundancy.No information is lost in lossless compression.

Vector Quantization (VQ) has achieved a mature development in information theory and signal compression. It aims at exploring the geometric structure and statistic property of the data points and quantizes the vectors into several centroids. Product Quantization (PQ) or Product Code is a special subclass of VQ.

Vector Quantization and Signal Compression by Allen Gersho ...
Vector quantization (VQ) is a kind of signal compression method. CELP coding uses the VQ method to compress data, such as an excitation signal, LPCs, and codebook gain. VQ concerns the mapping in a multidimensional space from a (possibly continuous-amplitude) source ensemble to a discrete ensemble.

Inspired by this, we propose a new framework for image compression that combines compressed sensing theory with wavelet and vector quantization. Wavelet transform is used to sparsify the input image while measurement vectors generated from the sparse vectors are transmitted using vector quantization.

Mathematical properties. Because quantization is a many-to-few mapping, it is an inherently non-linear and irreversible process (i.e., because the same output value is shared by multiple input values, it is impossible, in general, to recover the exact input value when given only the output value).. The set of possible input values may be infinitely large, and may possibly be continuous and ...
